ABSTRACT

An emulsion composition comprises a graft copolymerized emulsion obtained by adding a monomer or monomeric mixture containing at least 70% by weight of a (meth)acrylic monomer to an oil-in-water type emulsion containing an organopolysiloxane having an organic group containing a radical reactive group or SH group, and effecting emulsion graft polymerization of monomer to organopolysiloxane. The emulsion composition is capable of forming an elastic, flexible coating having weather resistance, water resistance, water repellency, adhesion and heat resistance and maintaining these properties over a long period of time, and thus suited for building materials.
